

# Packet Tracer Cheat Sheet by carter.fendley

Work in progress cheatsheet for Packet Tracer. If you see any errors or have any improvements email: carter.fendley@gmail.com

packettracer

## Notes

**How to use this cheat sheet**

In order to use the commands you *MUST* be in the mode that that command is listed under. The sections are listed in order progression. "User EXEC Mode" is the default mode and thus has no command to enter it.

*Example:* In order to use the `hostname` command I must be in "Global Config Mode" so I look one section before to look up the command to enter "Global Config Mode". I then see that in order to use the `configure terminal` command I must be in "Privileged EXEC Mode" and to enter "- Privileged EXEC Mode" I must use the command `enable` in "User EXEC Mode". This would give this string of commands: `enable > configure terminal > hostname <hostname>`

**When in doubt google**

If you are asked to do something that is not on this cheat sheet google it. For example if you are asked to deny all incoming information from a IP google "How to deny incoming IP cisco packet tracer"

**Command conventions**

When you see a command like `ip address <ip> <subnet>`, the `<ip>` and `<subnet>` part mean that in order to use this command you need to substitute information into those places.

*Example:* If I wanted to set the IP to 192.168.1.1 with a subnet mask of 255.255.255.0 I would fully replace both the `<ip>` and `<subnet>` sections with that information. I would end up with a command that looks like:

ip address 192.168.1.1 255.255.255.0

## Universal Commands

Exit the current mode

exit

## User EXEC Mode Commands

Enter Privileged EXEC Mode

enable

## Privileged EXEC Mode

|                                |                                    |
|--------------------------------|------------------------------------|
| Enter Global Config Mode       | configure terminal                 |
| Save current config            | copy running-config startup-config |
| Save current config            | write memory                       |
| Show running config            | show running-config                |
| List all interfaces            | show ip interface brief            |
| List all interface information | show interface                     |
| List all show parameters       | show ?                             |
| List all debug parameters      | debug ?                            |

### Overview

Desktops do not have a router or switch like CLI. In order to configure settings on desktops you must click on them and then navigate to the "Desktop" tab. Here you can use the different apps to preform different operations. See below for specific operations help.

### Setting an IP

Click on the "Configure IP" desktop app. Here you can input IPv4 and IPv6 addresses as well as other networking information. When you are done you can simply exit out and it will be saved.

### Navigating to a web page

Use the "Web Browser" app as you would a normal web browser

### Pinging IPs

Use the "Command Prompt" app and use the command `ping <ip>` in order to see if a host is up.

### How to tell what mode you are in

|                       |                       |
|-----------------------|-----------------------|
| User EXEC Mode        | Router>               |
| Privileged EXEC Mode  | Router#               |
| Global Config Mode    | Router (config)#      |
| Interface Config Mode | Router (config-if)#   |
| Line Config Mode      | Router (config-line)# |

|                                  |   |
|----------------------------------|---|
| Enter Interface Config Mode      | interface <interface> <port>  |
| Enable IPv6                      | ipv6 unicast-routing  |
| Set Default Gateway              | ip default-gateway <gateway>  |
| Set Hostname                     | hostname <hostname>   |
| Enter Line Config Mode           | line <line> <startport> <endport> (lines: console, vty)                               |
| Enable Secret Password           | enable secret <password>  |
| MOTD                             | banner motd #<motd>#  |
| Enable Password Encryption       | service password-encryption   |
| Add new user                     | username <username> secret <password>   |
| Enable AAA                       | aaa new-model   |
| Populate default AAA method list | aaa authentication login default <method> <method1> <methodN> (see methods below)     |
| Populate new AAA method list     | aaa authentication login <list-name> <method> <method1> <methodN> (see methods below) |
| Set max fails AAA                | aaa local authentication maxfail <maxfail>  |

### AAA Auth Methods

enable – uses enable password  
 krb5 – uses Kerberos 5  
 krb5-telnet – uses Kerberos 5 Telnet protocol  
 line – uses line password  
 local – uses local username database  
 local-case – uses local username database (case-sensitive)  
 none – no authentication (don't do this)  
 cache <group name> – uses cache server group  
 group radius – uses list of all RADIUS servers  
 group tacacs+ – uses list of all TACACS+ servers

### Interface Config Mode

|                     |                                |
|---------------------|--------------------------------|
| Set Static IPv4     | ip address <ip> <subnet>       |
| Set Static IPv6     | ipv6 address <ipv6>            |
| Set IPv6 Link Local | ipv6 address <ipv6> link-local |
| Set duplex to auto  | duplex auto                    |

**NOTE:** When exiting Interface Config Mode you must issue the command `no shutdown` before `exit` if you wish for the interface to remain up.

### Line Config Mode

|                                   |                                  |
|-----------------------------------|----------------------------------|
| Set password (user EXEC)          | password <password>              |
| Enable password checking at login | login                            |
| Enable default AAA list           | login authentication default     |
| Enable AAA list                   | login authentication <list name> |
